DATAWEB – SPIDERVERSE IDEATHON

Project SpiderNet: Global Crime Intelligence & Forecasting Grid

The Vision

Across the SpiderVerse, every thread in the web carries information. A vibration in one corner signals disturbance across the entire network.

Modern crime operates the same way. Organized networks, cyber threats, coordinated activity, and emerging risk clusters span cities and borders. Yet intelligence systems remain fragmented, reactive, and siloed.

Project SpiderNet proposes a **digital intelligence grid** that senses disturbances across a global data web and transforms fragmented signals into structured, explainable foresight.

Ideathon Objective

Design an AI-powered Crime Intelligence & Forecasting Platform that simulates a modern, globally coordinated intelligence network.

- Ingest multi-source structured and semi-structured datasets
- Detect anomalous activity patterns across regions
- Correlate cross-domain signals
- Forecast emerging risk zones or coordinated clusters
- Generate explainable intelligence briefings grounded strictly in data

The system must function as a **Digital Spider Sense**, identifying weak signals before they escalate.

Illustrative Scenario

A spike in cyber incidents coincides with unusual transaction flows and social signal anomalies across multiple regions.

SpiderNet detects similarity with historical coordinated patterns and forecasts possible expansion within a defined timeframe.

The system generates a structured intelligence report outlining detected correlations, risk scores, and recommended interventions.

PPT Submission Structure

- Slide 1 – Problem Understanding and Differentiation
- Slide 2 – Architecture, Innovation and Technology Stack
- Slide 3 – Feasibility, Output and Impact
